Chapter 12 assignment

I went on to https://theartifox.com/ to inspect how the site was made. I've always loved the pure, elegant and simple look of an interior design/furniture website. But under the hood it was anything but simple! So many things that seemed simple now I can appreciate. I now understand why HTML, CSS and Javascript are kept separate. Websites have a lot of components and just looking at the sheer amounts of <div>s makes me want to shiv my computer screen.

As I inspected through the website I saw the use of CSS normalize or reset where the CSS will set the margin, padding, border, font-size, etc to a specified size. When I was working on my final project(which I've started and restarted a couple times) it was extremely frustrating trying to understand why some content would spill over to other content/margin/border. As I get deeper into the journey I'd love to make responsive web designs and have a deeper knowledge of javascript to make funny/fun/intelligent/stupid/interactive websites!

Chrome's inspect tool will be extremely valuable when I make websites in the future not only for inspiration but to understand the tools of the web development trade!
